

Many countries are experiencing population growth and need more homes. Should these new homes be constructed in existing cities or should new towns be built in the countryside?

Due to growth in population, many countries require more homes. In my opinion, new towns should be built in the countryside. As a result, new employment centres would be developed. In addition to that new opportunities will be provided to create a planned city, which will benefit the resource allocation and waste management.

When population grows in a country, joblessness can be considered as one of the most alarming issue. Whenever a new town is created, it provides with a spate of employment avenues. For instance, every critical government building like hospitals, Post-offices, police station, etc. has to be constructed from ^{the} scratch. Also, people will not migrate to places very far from their homes in search of work. Consequently,

a large number of people would not be concentrated in just few big cities, population will be evenly distributed.

Another major advantage of building new town is that everything can be planned from the very beginning. Because everything will be managed with a vision, life is going to be extremely beneficial for the residents. Take, for example, roads can be designed in such a manner that it results in the decline of traffic jams, which in turn saves a lot of precious time. Furthermore, the innovations introduced in such solid waste management, sewage system, etc. while developing new towns are not only going to benefit the residents but also the environment. Therefore, it is a multi-pronged by building new towns in countryside will present new job opportunities and help the population to exist more evenly by reducing burden from big cities. Also, newly created town can be planned so that it is beneficial to the environment and its residents.
