

A

With the technology advancement, people are able to survive more resulting in increase in ^{the world} population. This has in turn led to the issues of feeding such large number of people. It is argued that GM foods would help to with this problem. However, I strongly ^{dissagree} ~~dis~~ to various health concerns.

Obviously GM foods have their benefits. One of the biggest advantage of GM foods is its availability ^{throughout} ~~around~~ the whole year compared to the ~~it~~. It also has a significantly faster growth rate when compared to ~~leading~~ conventional food, ^{that is} available by farming.

Regardless, there are many problems related to GM foods. Firstly, this GM foods can have an effect on the nature, as this are not natural

foods, it may hamper the ecosystem. ^{secondly,} many studies have suggested that GM foods many people are affected by GM foods as it gives rise to various allergies ~~and it decreases~~ and are ^{also} resistant to antibiotics. Another big concern with the production of GM foods is that its affect to the traditional farmers. With the increase in GM foods farmers are getting unemployed and this can have a serious impact on countries. the economy of countries.

In conclusion, though GM foods have its benefits, but its health concerns, economic problem and its impact on the ecosystem outweigh its benefits. Therefore I strongly disagree with the idea of using GM food as a viable solution to the issue of food shortage due to increasing world population.
