

## WRITING TASK-1

Date .....

The diagram illustrates the way wood pellets are produced, for heating the buildings.

Overall, the process consist of 7 stages, beginning with arrival of sawdust from sawmill and ending with packaging of pellets for sale purpose.

First of all, the sawdust is being produced through sawmill. To elaborate, the manufacturing process happened through hammer mill by hammering the sawdust into the fibres twice. Then, fibres get dampened with steam. After that, those fibres are pushed into a pellet machine through holes, which transformed into pellet. Next, pellets get cooled down and vacuumed off the dry dust to clean the pellets. Lastly, these pellets get wrapped into 18 kilo bags (40 pounds) to sell out.
