

causes - better healthcare
- not having kids

- governmental incentives

The increasing problem of aging population has been a cause of concern for most developed nations. We will discuss the problems arising out of it and possible solutions to curb the issue.

The biggest reason for increase in aging population is the advanced healthcare facilities available to the public. This has resulted in increasing the life expectancy of developed countries which raises the proportion of elder people to the young ones. Most of the elderly people are not able to contribute to the economic development of a nation. Furthermore, in order to escape responsibilities of children, many young couples do not like to have kids. This has also been a key driver for increasing elderly population.

The most immediate solution for the problem is the immigration of people from highly populated countries to the developed nation. This will help in reducing the problem of aging population and will also be beneficial for bringing in foreign capital to the host nation. For instance, the practice has been widely common among countries such as Australia and Canada. However, the longer term solution has to be government incentivizing citizens of the country to have kids. This can be done by providing them with the financial aid to raise children.

In conclusion, the causes for aging population has been better healthcare facilities and younger couples not having kids. This problem can be solved by immigrating people from densely populated countries and government incentivizing younger generation to have kids.
