

In the modern world with the improvement in medical treatment and proper nutrition, human life span has significantly improved while this is a good news but problems can be ~~causes~~ caused in some cases for both persons and community, some potential measures and reason behind this is highlighted in the essay given below.

There are two ~~main~~ ~~reasons~~ major problems to begin with, the ageing population will bring about rising cost to society. As citizen age and grow weaker, society's tax burden build up. Moreover if a large amount of population is elderly and retired, pension cost and taxes will increase, thus creating a burden for younger tax-paying individuals and authorities. Additionally, older members of society will required more specialised care as they often get sick and their health worsen. ~~As~~ Clearly, this will bring higher medical cost with increased demand.

However, there are some steps that both government and individuals can take to mitigate these problems. Firstly, an increase in retirement age would offset increasing costs from older generation.

☞ If people are able to retire later, the age for receiving government-funded state pension would rise and also ageing population can pass on the knowledge and train younger workers. Secondly promoting programs and initiatives in health care industry will eliminate risks from aforementioned problems also this will help future generation as they get older.

In summary, various measures can be taken in order to offset above problems from the ageing population. It is crucial that both government and individuals work together in this venture.
